

## ESA0050

### EyeSafe Tabs

**EyeSafe Tabs** are used for covering the eyes during surgeries while the patient is under anaesthesia. Currently various gels are used to avoid dry eyes and nurses must check if the eyes have dried out on a constant basis. Dry eyes can lead to eye injuries. The current common application used to avoid dry eyes is medical tape. This application can harm the skin, eyebrows and eyelashes. Medical tape is not transparent, when in use, you are unable to see the position of the eyes, it also does not fit the anatomy of the eye properly. Toffeln's **EyeSafe Tabs** offer an effective solution to prevent these issues occurring.

### Key Features

- › Coloured, ergonomic and non sticky handle
- › Designed to fit eye anatomy perfectly
- › Transparent material
- › Hypoallergic and medical grade material
- › Latex free
- › Patent protected

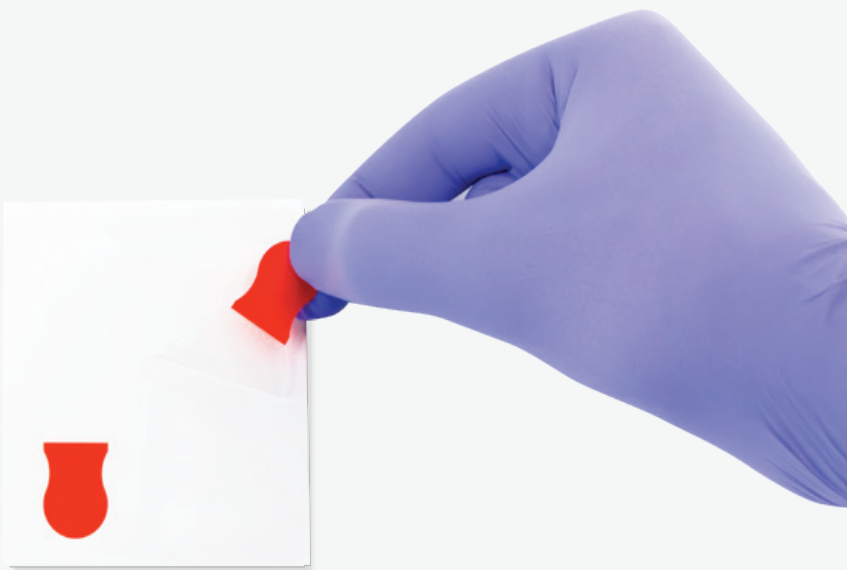

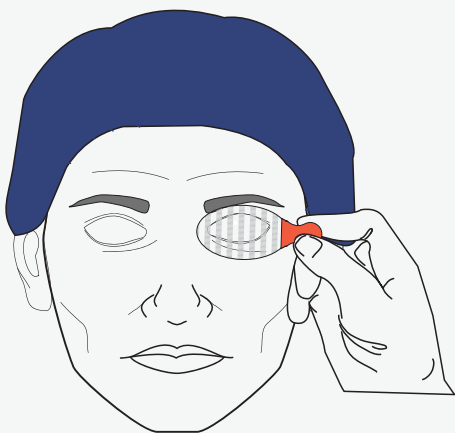

### Advantage for Patients

- › Does not hurt the skin, eyebrows and eyelashes while removing (post operation).
- › Protects eyes from external splashes during the operation.
- › Eyes do not dry out even during long operations.
- › Medical grade material avoids any skin irritation (even on sensitive skin).
- › Reduces corneal abrasion risk.

## Advantage for Healthcare Professionals

- › The transparent structure makes for easy pupil dilation control and is visible at any time without removing the EyeSafe tab.
- › The coloured, non-sticky handle allows for easy and fast application and removal. This reduces the operational risk and saves on application time.
